

Forensic Protection for User to User Platforms

Solution Overview

Image Angel: Invisible Accountability for Digital Spaces

The Problem

All content shared online carries a risk. Screenshots, leaks, and unauthorised sharing can devastate trust, violate privacy, and expose platforms to legal and reputational harm.

Our Solution: Forensic Watermarking and Reporting System

Image Angel embeds a unique, invisible fingerprint into each digital asset at the moment it's accessed. This server-side solution is:

- Invisible: No visual alteration to the image.
- Durable: Survives screenshots, printing, filters, cropping, and re-encoding.
- Traceable: Identifies the source of unauthorised sharing.

This technology doesn't mark ownership, it enforces accountability.

How It Works

1. Access: When a digital asset is requested, our API delivers a version embedded with a unique, invisible watermark specific to that content viewer.
2. Monitoring: If the image, or screenshot of a video frame appears elsewhere, our tools can extract the watermark to identify the source.
3. Action: We provide verifiable evidence to support legal or platform enforcement actions.

Benefits

- Enhance Trust: Show users you prioritise their safety and privacy.
- Ensure Compliance: Meet regulatory requirements with proactive measures.
- Protect Revenue: Deter leaks that can harm your brand and bottom line.

Integration

Our solution integrates seamlessly with your platform:

- API-Based: Minimal impact on performance.
- Scalable: Suitable for platforms of all sizes.

- Supportive: We offer guidance throughout the integration process.

Pricing

Our pricing is based on active users/month, ensuring scalability.

Why Image Angel?

Unlike other solutions, Image Angel is built with a focus on:

- Survivor Support: We prioritise the rights and safety of content creators.
- Platform Integration: Designed specifically for user-to-user sharing platforms.
- Ethical Accountability: We create friction for perpetrators, not users.
