

**Question 1: Which of the three options do consultees favour, and why?:**

Option 2. Audio description has made TV viewing accessible and enjoyable to me. I would like to be able to access much more, and I feel this should be available to all visually impaired people.

**Question 2: Do consultees have any further suggestions for future access service provision? If so please provide the rationale for these suggestions:**

I think Freeview and Sky etc menus should talk as the viewer scrolls around to enable the visually impaired user to be able to choose menu items, channels, etc. For example a voice would read the item in focus, and the user can then choose to select that item or scroll to the next item. The rationale is that this would open up the screens to visually impaired people.
