

After reading the consultation, I favour option 2. Audio description to 20% for all channels required to provide access services.

In the future it would be very useful for teletext to be turned into speech. It would help the visually impaired a great deal with information and news and events. It would be a great boost for them.

In the past a machine has been able to convert teletext to speech but it only works on an analogue system. Visually impaired people will lose a great deal of information when we go to digital.
